

Systems Approach in the Vehicle Technologies Program

Terry Penney, Technology Manager
National Renewable Energy Laboratory

**Presented at: Systems Analysis Approach to Solar
Program Planning and Management Meeting
Dec. 17-18, 2002**

Important Steps in Implementing Systems Analysis Tools

1. Understand what questions should be asked
2. Answer the questions
3. Show technical trade-offs through partnerships
4. Use industry tools and co-simulation if possible
5. No one system tool gives all the answers — use a suite of tools
6. If analysis doesn't show unique insight, then it doesn't earn value

Evaluating High Frequency AC Heating of Batteries at very Cold Temperatures

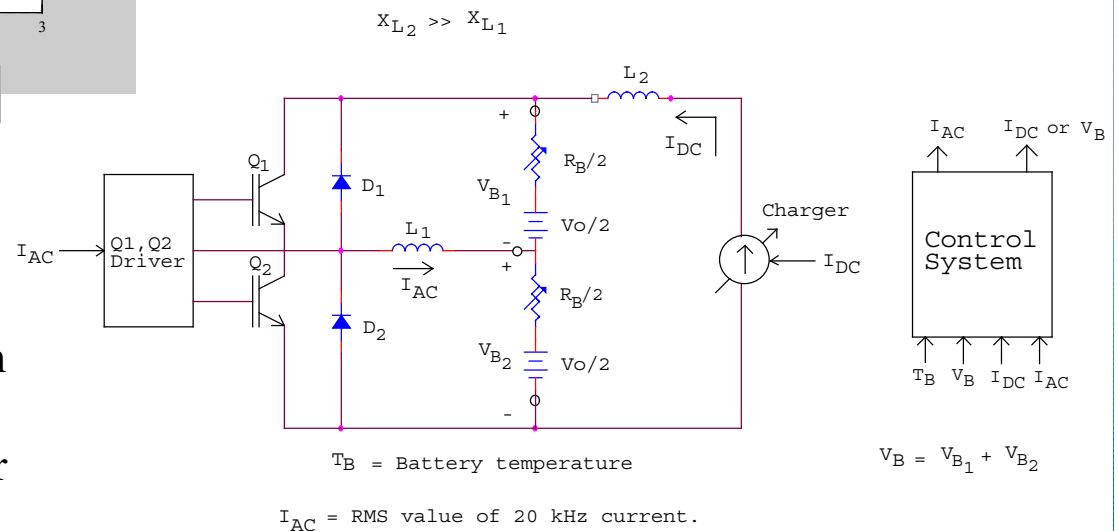

Average Temperature at 2 minutes (°C)

Uniform Input Heat over 2 minutes (Whr)

- Analysis has shown that core heating batteries is the most efficient and effective method.
- Core heating can be achieved by applying high frequency AC power through battery terminals
- Because of high battery resistance at low temperature battery heat up

- We are working with University of Toledo to evaluate various AC heating techniques
- Initial results show that a non-operation lead acid battery at -40°C can be warm up quickly to deliver satisfactory power

ADVISOR and Technical Targets Tool

Introduction to ADVISOR

- ADVISOR = **AD**vanced **VehI**cle **SimulatOR**
 - simulates conventional, electric, and hybrid vehicles (series, parallel, or fuel cell)
- Distributed freely to public on NREL's web site

ADVISOR's User Growth Has Exceeded Expectations (over 6,000 people)

2/3 of Users are from Industry, Major Auto OEMs, and Suppliers

- Ford Motor Company
- Visteon
- DaimlerChrysler Corporation
- General Motors
- Delphi
- Volvo
- Siemens Automotive Systems
- Ricardo, Inc.
- Hyundai Motor Company
- Honda
- Hitachi Ltd.
- Fiat
- Eaton Corporation
- Nissan Motor Company
- Mathworks
- FEV Engine Technology
- Renault
- Mitsubishi Motors Corporation
- Flowmaster
- AVL
- Denso Corporation
- Allison Transmission

What Does Industry Have to Say About NREL's Systems Analysis Team and ADVISOR?

DAIMLERCHRYSLER

"These are very powerful tools and essential in the development of our hybrid vehicles at DaimlerChrysler."

Min Sway-Tin, Supervisor HEV Electrical Engineering
HEV Platform Engineering
DaimlerChrysler Corp.

"ADVISOR has been invaluable in Delphi's development of codes to predict the performance of stop/start and integrated starter generator vehicles."

John MacBain
Staff Research Engineer
Delphi Automotive Systems

"... We have found this collaboration to be very helpful since the NREL team brings new, fresh, out-of-the-box ideas and high level technical expertise."

Tsung-Yu Pan, Ph.D.
Senior Technical Specialist, Manufacturing Systems
Ford Research Laboratory

Technical Targets Tool Motivation: Produce National Impacts Due to Potential Changes in Technical Targets

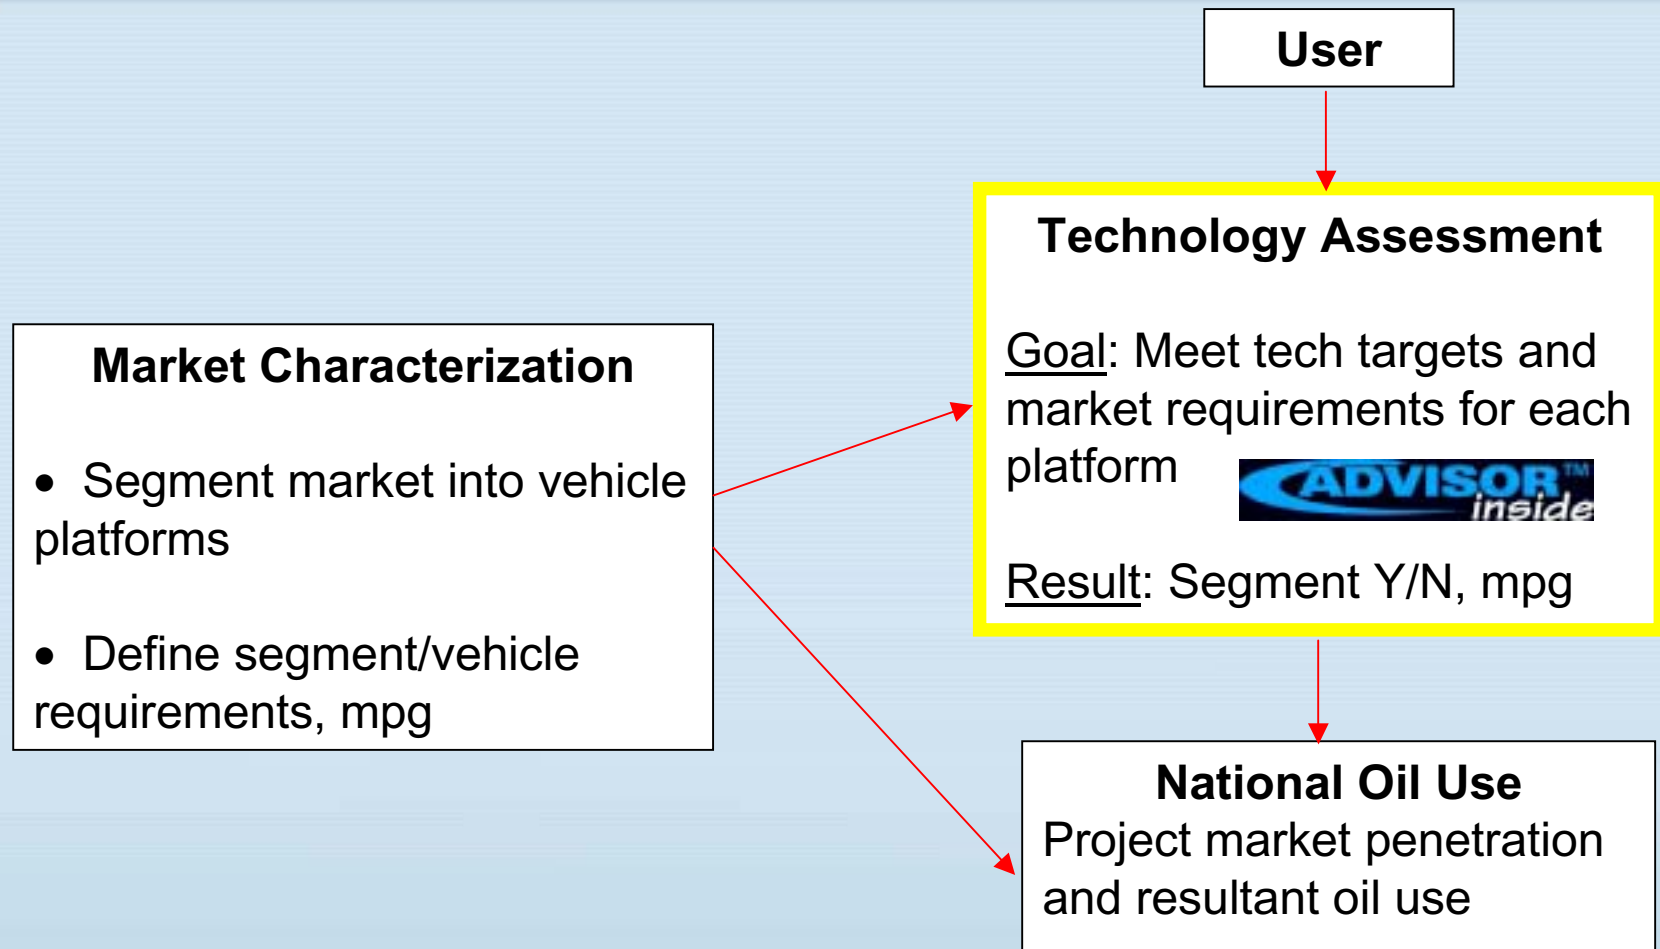

Objectives of Technical Targets Tool

- Provide a tool to assess/compare impact of various tech team targets
- Allow changes tech team target values, and have ADVISOR define vehicles and estimate fuel efficiency
- Consider the ability of the new technology vehicle to penetrate a multi-platform market
- Figure of Merit: **national oil savings**

Technical Targets Tool Approach

Reference Vehicle Attributes

- **Physical**
 - Curb mass, glider mass, C_D , A_f , wheelbase, tires
 - Available space for new powertrain

The authors use a multi-objective optimization technique to determine the optimal degree of hybridization for a sport utility vehicle (SUV). The authors use a multi-objective optimization technique to determine the optimal degree of hybridization for a sport utility vehicle (SUV).

- Coarse parametric sizing study indicated optimal fuel cell to system power ratio of 0.25-0.3 for fuel economy
- Determined that derivative-free optimization algorithms necessary for complex design space of HEVs
- Drive cycle influences optimal degree of hybridization and control parameters
 - NEDC provides robust design
- Fuel cell transient response capability critical for neat fuel cell vehicle
- An optimized hybrid design can nullify the effects of fuel cell transient response

Traditional Approach - Equipment Emphasis

VERSUS

REDUCE LOAD

EFFICIENT DELIVERY

EFFICIENT EQUIPMENT

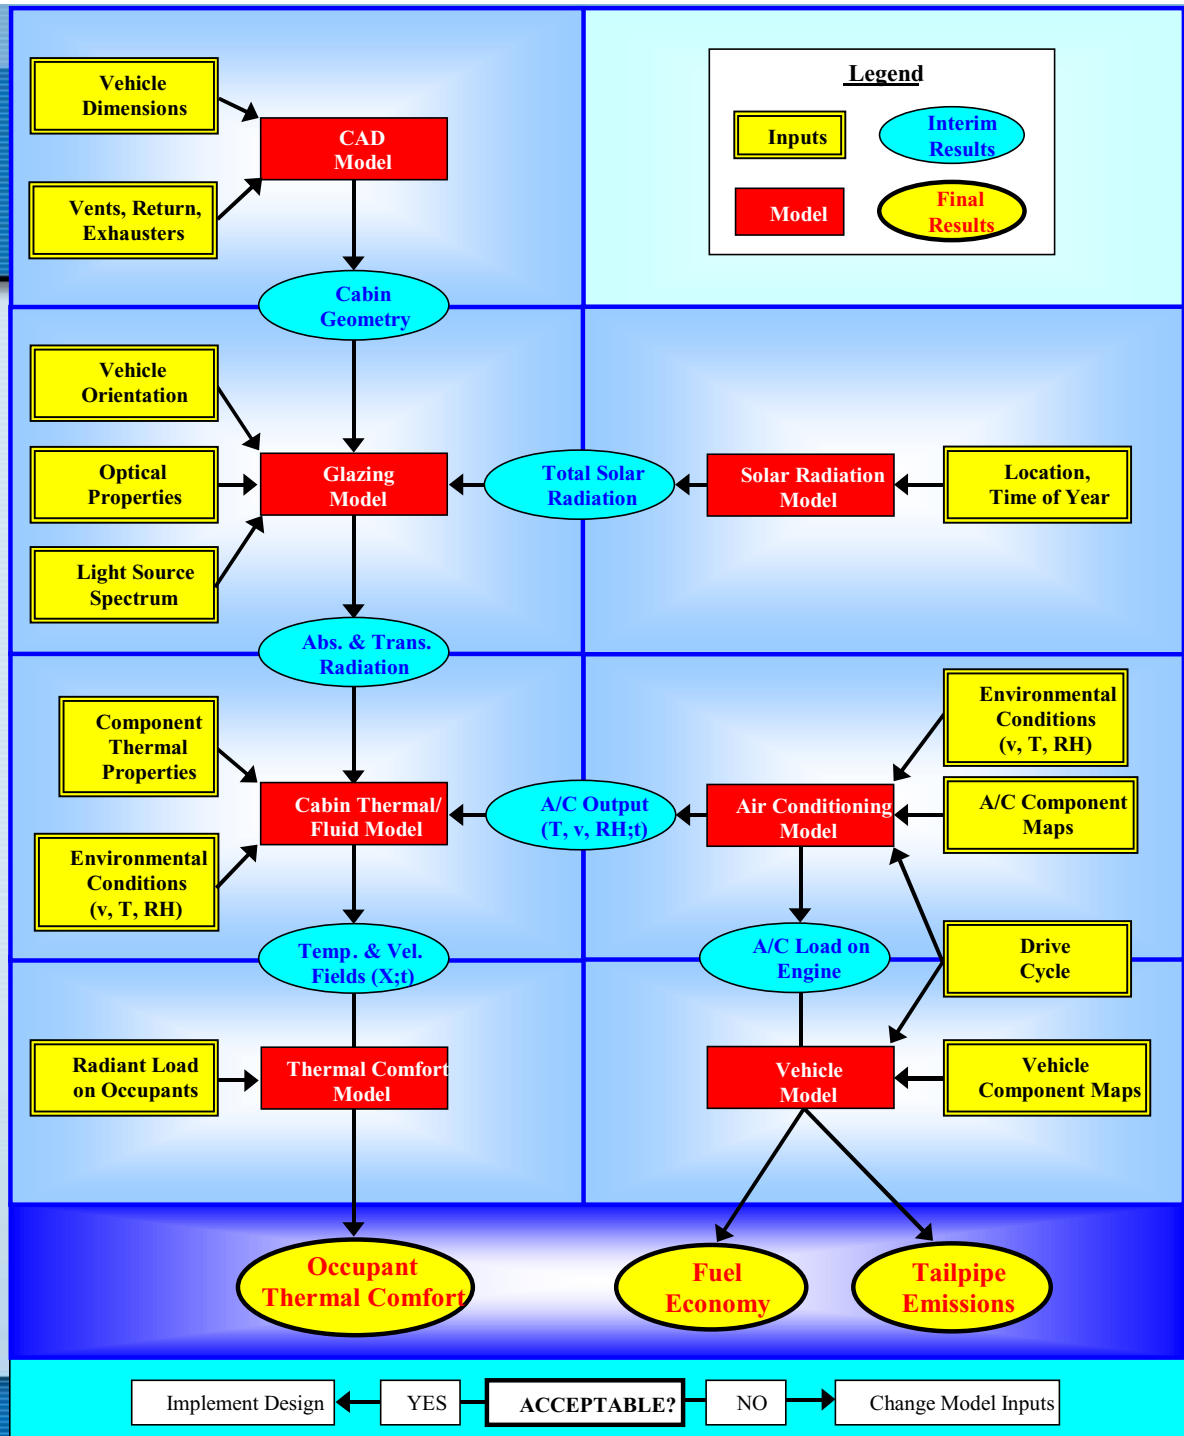

Decreases in load have a larger impact on fuel use due to equipment and delivery losses.

What Can Be Done?

- Reduce Load
 - Solar Reflective Glazing
 - Body Insulation
 - Parked Car Ventilation
- Efficient Delivery
 - To the occupant
- Efficient Cooling Equipment
 - Closed loop control – cabin feedback
 - Engine waste heat
 - Optimization

An Integrated Systems Modeling Approach Is Needed for Diverse Technology and Supplier Base

Potential uses for Systems Analysis in Solar/Renewable Applications

- How does our nation's total solar generation increase over time? We could plot solar-generated power by state by day and year.
- Where are the solar collectors? What is the daily variability in those areas?
- Which states are leaders in renewable energy?
- How can DOE give incentives to states to build more renewable/solar resources?

On Target for a Systems Approach

- Opportunities surround you
- Use existing resources
- Industry partnerships can play a big role
- Ask the right questions
- Think outside the box – be creative!
